Selective Soldering Innovator A.C.E. Expands to New Facility

Spokane, Washington, USA – A.C.E. Production Technologies, a leading supplier of selective soldering systems for electronics assembly, announces its expansion to a new 18,000 sq. foot office and manufacturing facility. The move was prompted by unprecedented growth fueled by an increase in systems sales of over 500% in 2006, according to Al Cable, President. "Our new facility is perfectly suited to our current needs, and we anticipate that it will be able to accommodate our expected growth at least for the near future" he said.

The new facility, located in the Spokane area only four miles from where the business was founded in 2005, previously housed a circuit board contract manufacturing company and is fully equipped for ESD protection of circuit assemblies. "This new facility will give us room to grow in the near future as we expand into the European and Asian markets" Cable added.

A.C.E. Production Technologies manufactures affordable batch load and in-line lead-free capable selective soldering machines and support modules for electronics assembly. The company's KISS family of selective soldering machines offers unique features, programmability, and flexibility in robust, affordable systems that are designed to fill the gap between hand soldering and more expensive automated inline robotic selective soldering.

For more information about A.C.E., including sales and technical, contact Craig Curk, National Sales Manager, at 2 Major Ct., Wilder, KY 41076; Tel. 859-441-

2223, e-mail sales@ace-protech.com. For general information about
