Dear Alan:

This letter is to give my highest recommendation for your “selective soldering machine.” After much investigation and some reservation, because we have never owned this type of machine, we purchased your model KISS-103. We included in our purchase both “leaded” and “lead free” platforms including a 3” “wave soldering nozzle” and a “drop jet fluxer”

We received the machine on Friday and your man Steve showed up first thing the following Monday to stay the week. He unpacked the machine and it was up and running by the following day. We were happy to see that the total electrical requirement was a single dedicated 120VAC outlet. We found the nitrogen tank locally and used a small internal “Fume Extracting System” eliminating the need for an outside duct and exhaust fan. We were running production by Wednesday and the rest of the week was dictated to training.

The machine is a lot easier to program than I thought. It does not require you to write the program but asks you to answer simple questions, then you fill in the information and it writes the program automatically. It also has a feature that I have rarely seen... when you load in the program it automatically checks each line for errors and stops at an error requiring a correction.

Overall the machine exceeds my expectations for ease of use and maintenance. The manual that is provided is short, easy, and to the point. It has performed constantly well providing no problems. Also, your “customer support” has been a great help in answering our questions.

Yours truly,

Robert A. Cims
Director of Operations
